

**FRAMES** resources may be organized in three categories: Partner Sites, Geographic Areas, and Subject Areas. Partner Sites are hosted by FRAMES and contain resources that may be publicly accessible or available only with a login. Geographic Areas aggregate resources for wildland fire management according to the boundaries of the 11 designated Geographic Area Coordinating Centers (GACC). Subject Areas contain resources organized into topics of interest within the wildland fire community.

## Partner Sites

## Geographic Areas

## Subject Areas

## Collaboration

Collaboration Services including document & task management, calendars, and threaded discussions are available to FRAMES partners through a login.

# FRAMES

Fire Research And  
Management Exchange System

Providing website hosting,  
content management,  
and other web services  
to wildland fire and other  
natural resource researchers  
and managers.

<http://frames.nbii.gov>

## Information that Managers and Researchers can use

Based upon internationally established metadata standards, the Resource Cataloging System (RCS) is a tool for wildland fire and other natural resource professionals to discover new information resources or enter/catalog resources they have produced. In the RCS there are six resource groups: projects, models & other tools, documents, web pages, data, and programs (organizations).

## Resource Record Format

[illegible]

There are two broad functions of the RCS: Resource Discovery and Resource Entry. Discovery is accomplished through either a browse resource function or by searching.

## Search Resources

## Browse Resources

## Resource Entry

## Resource Cataloging Tool

Entry is achieved through use of the web-based Resource Cataloging Tool. Different components of that tool are illustrated here.

## Resource Discovery
